Where to Sell?

If we have two potential ***Supply Zones*** ***a safe approach would be to set a sell target at the first lower supply zone***

If we have two potential ***Supply Zones*** ***a safe approach would be to set a sell target at the first lower supply zone***

Where to Sell?

If we have two potential ***Supply Zones*** ***a safe approach would be to set a sell target at the first lower supply zone***

Takeaways

- Sometimes we can identify two supply zones at reversal candles located at the top of the preceding rally and a previous pullback labelled as b up.
The safe approach would be to sell at least half of the position as soon as price hits the lower ***Supply Zone***.
Once price hits the upper edge of the lower ***Supply Zone*** you can sell another ¼ of the position. At this point you can leave a sell order that will be automatically executed if and when price drops back under the lower edge of the lower ***Supply Zone***.
